- NP-complete problems

Credit: based on slides by A. Smith & K. Wayne

Quiz

For each of the following statements, decide T/F/Unknown.

- a) Let X be a problem in \mathbf{P} , then it **can** be solved in n^{2019} time.
- b) Let X be a problem in \mathbf{NP} , then it **cannot** be solved in n^{2019} time.
- c) If a problem is **NP-Complete**, then the best algorithm for it takes $\Omega(2^n)$ time.
- d) There exists a problem in \mathbf{NP} but not in \mathbf{P} .

NP-Completeness

Def. A problem Y is **NP-Complete** if

1. $Y \in \text{NP}$
2. $\forall X \in \text{NP}, X \leq_{P, \text{Karp}} Y$

Theorem. Suppose Y is **NP-Complete**, then Y is solvable in poly-time **iff**. $\text{P} = \text{NP}$

Pf.

- (\Leftarrow) If $\text{P} = \text{NP}$, then Y can be solved in poly-time since $Y \in \text{NP}$
- (\Rightarrow) If Y is solvable in poly-time, consider any $X \in \text{NP}$.

Since $X \leq_{P, \text{Karp}} Y$, X has a poly-time algorithm as well

I.e., $\text{NP} \subseteq \text{P} \rightarrow \text{P} = \text{NP}$

Fundamental question: Are there natural NP-complete problems?

The "first" NP-Complete problem

Theorem. Circuit–SAT is **NP-Complete** [Cook 1971, Levin 1973]

Input. A combinational circuit built out of **AND/OR/NOT** gates

Goal. Decide if there is a way to set the circuit inputs so that the output is 1?

Stephen Cook Leonid Levin

Example

Given. Graph G

Construction. Circuit K whose inputs can be set so that K outputs true iff. graph G has an independent set of size 2

$\binom{n}{2}$ hard-coded inputs
(graph description)

Establishing NP-Completeness

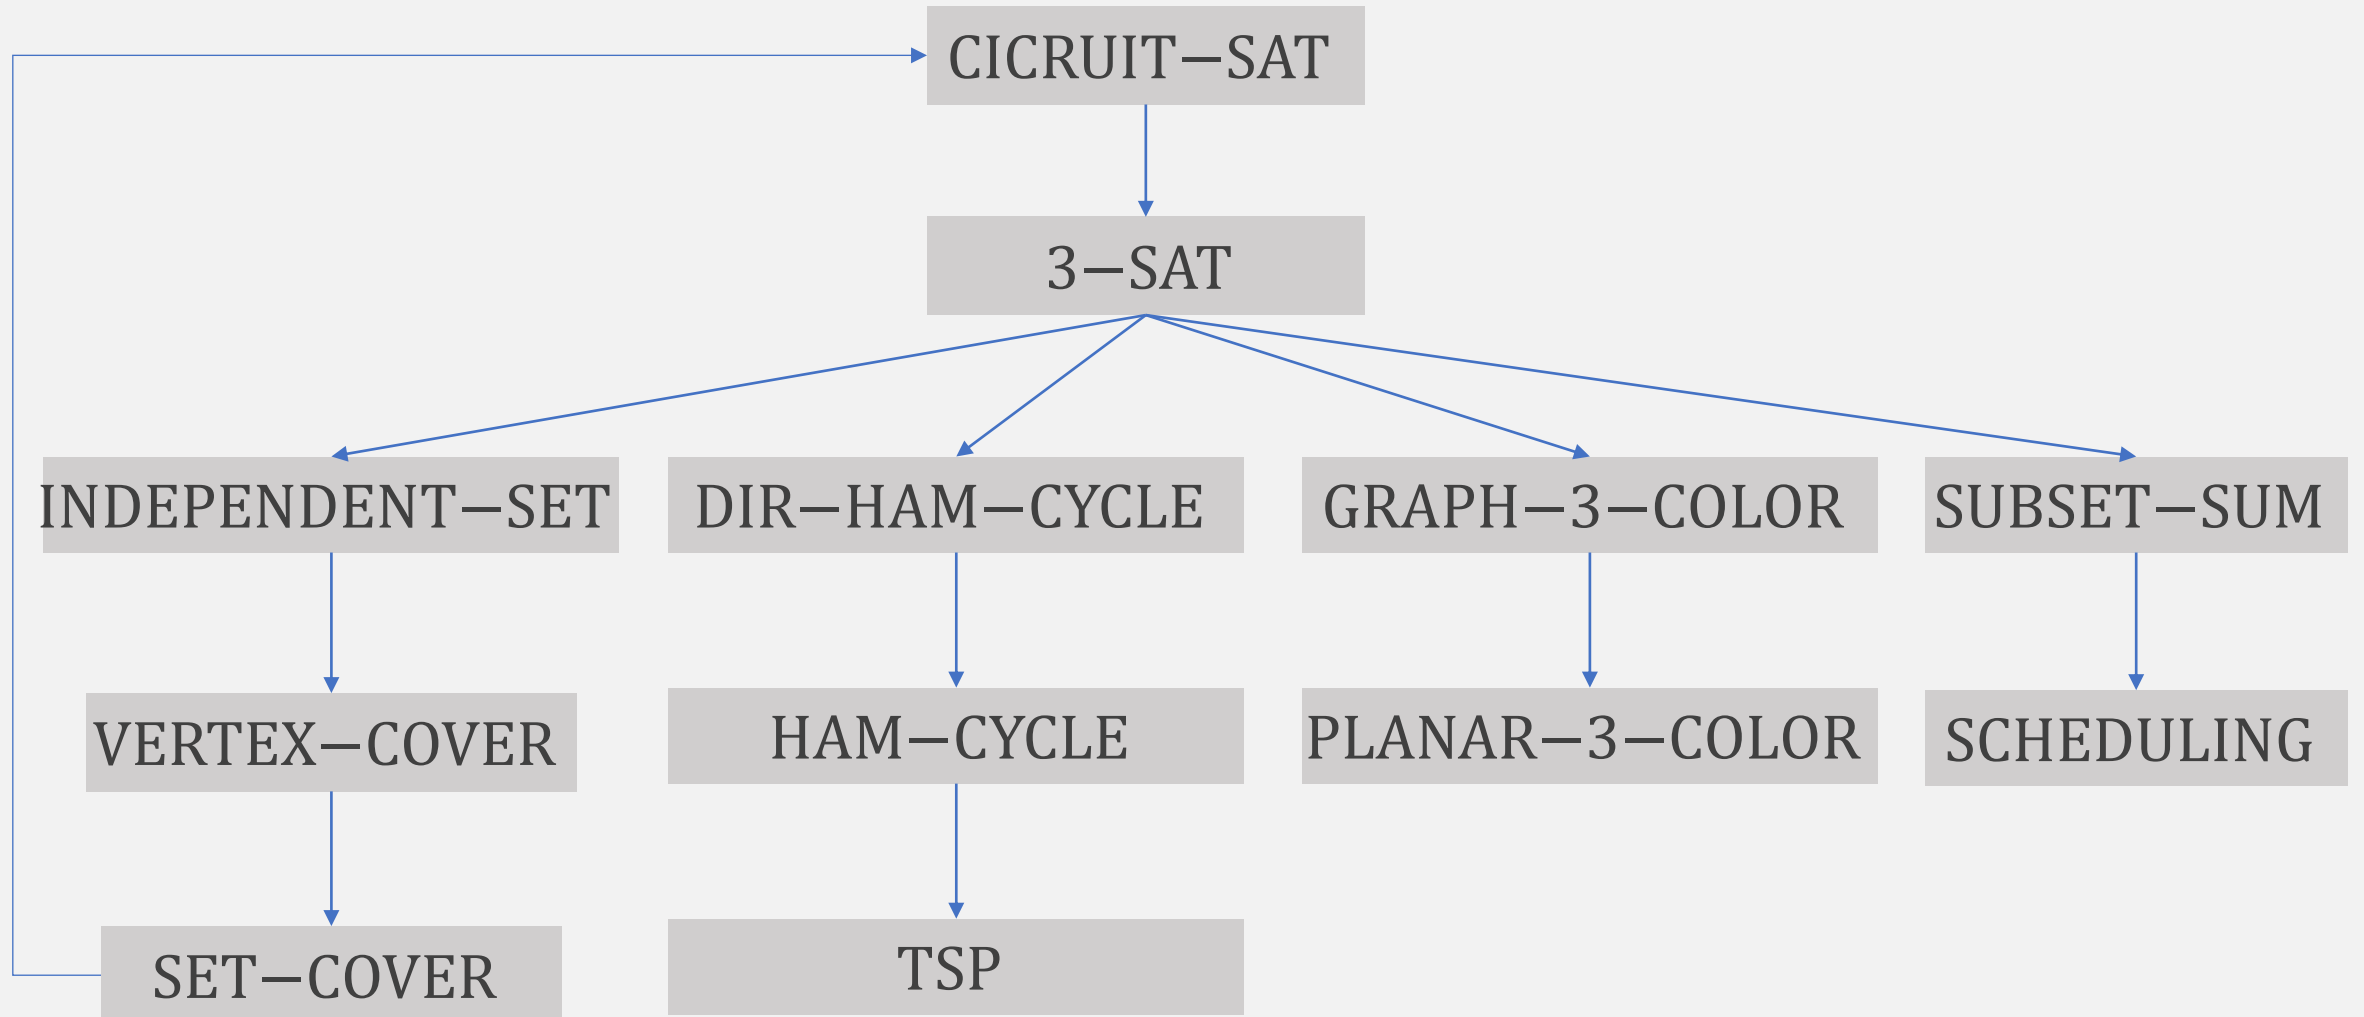

Once we establish **first** "natural" NP-complete problem, others fall like dominoes ...

Recipe to establish NP-Completeness of problem Y

1. Show that $Y \in \text{NP}$
2. Choose an NP-complete problem X
3. Prove that $X \leq_{P, \text{Karp}} Y$

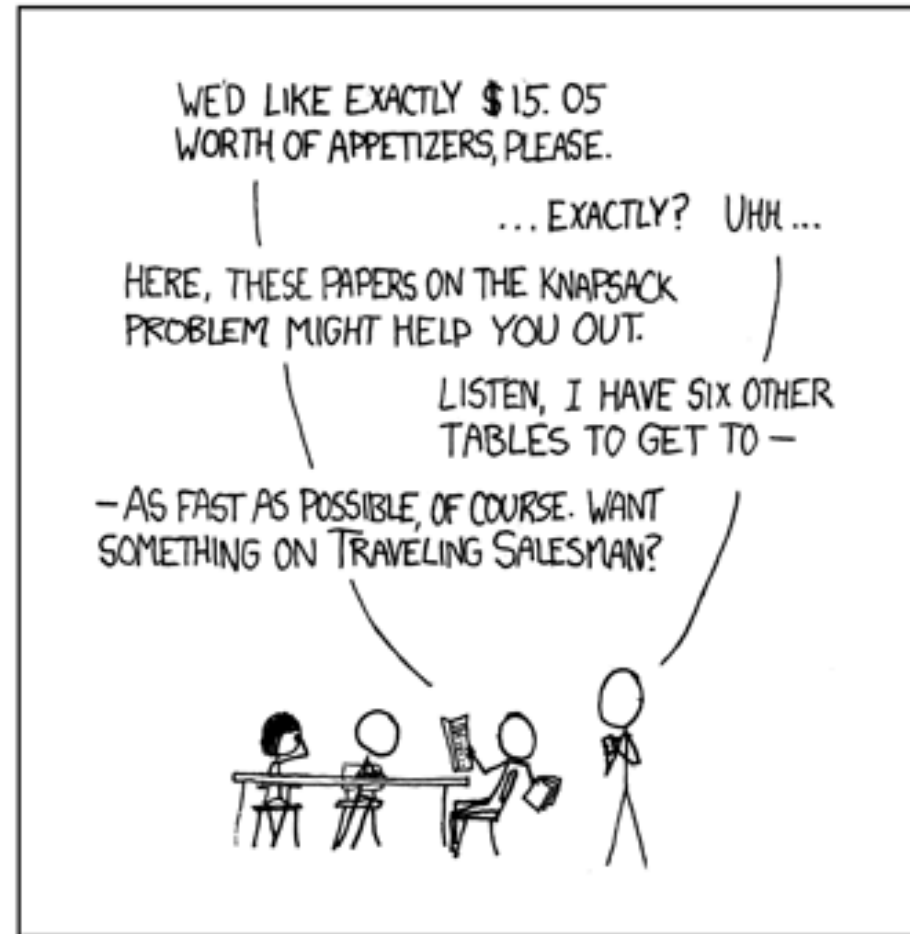

Justification. If X is an NP-complete problem, and Y is a problem in NP with the property that $X \leq_{P, \text{Karp}} Y$ then Y is NP-complete (by **transitivity**)

NP-Completeness

MY HOBBY: EMBEDDING NP-COMPLETE PROBLEMS IN RESTAURANT ORDERS

CHOTCHKIES RESTAURANT	
~ APPETIZERS ~	
MIXED FRUIT	2.15
FRENCH FRIES	2.75
SIDE SALAD	3.35
HOT WINGS	3.55
MOZZARELLA STICKS	4.20
SAMPLER PLATE	5.80
~ SANDWICHES ~	
BARBECUE	6.55

Modern Version

Practicing reductions

■ $\text{Circuit-SAT} \leq 3\text{-SAT}$

+

$3\text{-SAT} \leq_P \text{INDEPENDENT-SET}$
 $\leq_P \text{VERTEX-COVER} \leq_P \text{SET-COVER}$

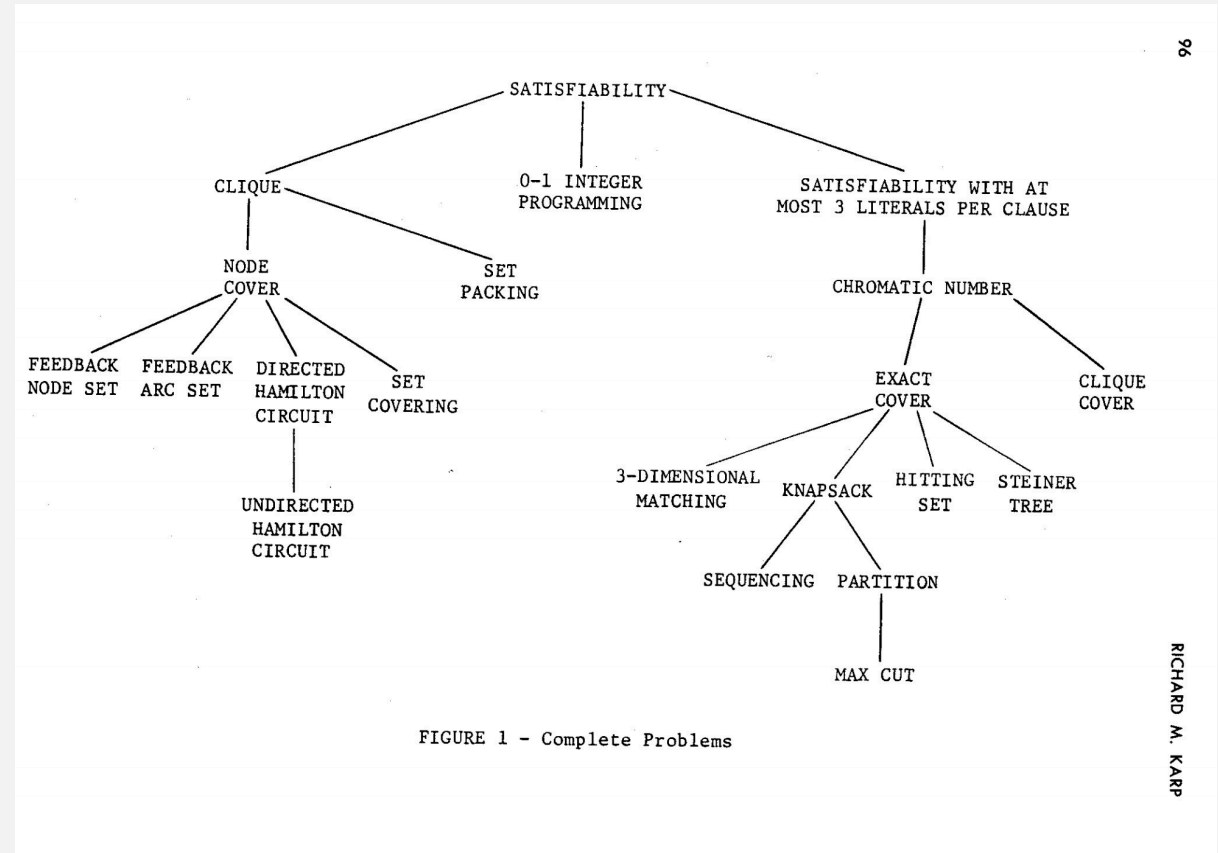

■ $3\text{-SAT} \leq \text{HAM-CYCLE}$

⇒ They are all NP-Complete!

Richard M. Karp

REDUCIBILITY AMONG COMBINATORIAL PROBLEMS [†]				
Richard M. Karp				
University of California at Berkeley				

3-SAT is NP-Complete

Theorem. 3-SAT is NP-Complete

Pf. We show $\text{Circuit-SAT} \leq_P 3\text{-SAT}$

- Given a circuit K , create a 3-SAT variable x_i for each gate
- Make circuit compute correct values at each node

$$x_2 = \neg x_3$$

$$x_1 = x_4 \vee x_5$$

$$x_0 = x_1 \wedge x_2$$

$$\Rightarrow x_2 \vee x_3, \overline{x_2} \vee \overline{x_3}$$

$$\Rightarrow x_1 \vee \overline{x_4}, x_1 \vee \overline{x_5}, \overline{x_1} \vee x_4 \vee x_5$$

$$\Rightarrow \overline{x_0} \vee x_1, \overline{x_0} \vee x_2, x_0 \vee \overline{x_1} \vee \overline{x_2}$$

- Hard-coded input values and output value

$$x_5 = 0 \Rightarrow \overline{x_5} \quad x_0 = 1 \Rightarrow x_0$$

- Final step: turn clauses into exactly 3 literals by adding dummy variables

$$\text{EX. } x_1 \vee x_2 \Rightarrow x_1 \vee x_2 \vee y, x_1 \vee x_2 \vee \overline{y}$$

Circuit K satisfiable iff.
 \exists truth assignment
satisfying all clauses
constructed

! Don't forget to show $3\text{-SAT} \in \text{NP}$

(DIR-)HAM-CYCLE is NP-Complete

(DIR-)HAM-CYCLE. Given a directed graph $G = (V, E)$, does there exist a directed cycle Γ that visits every node exactly once?

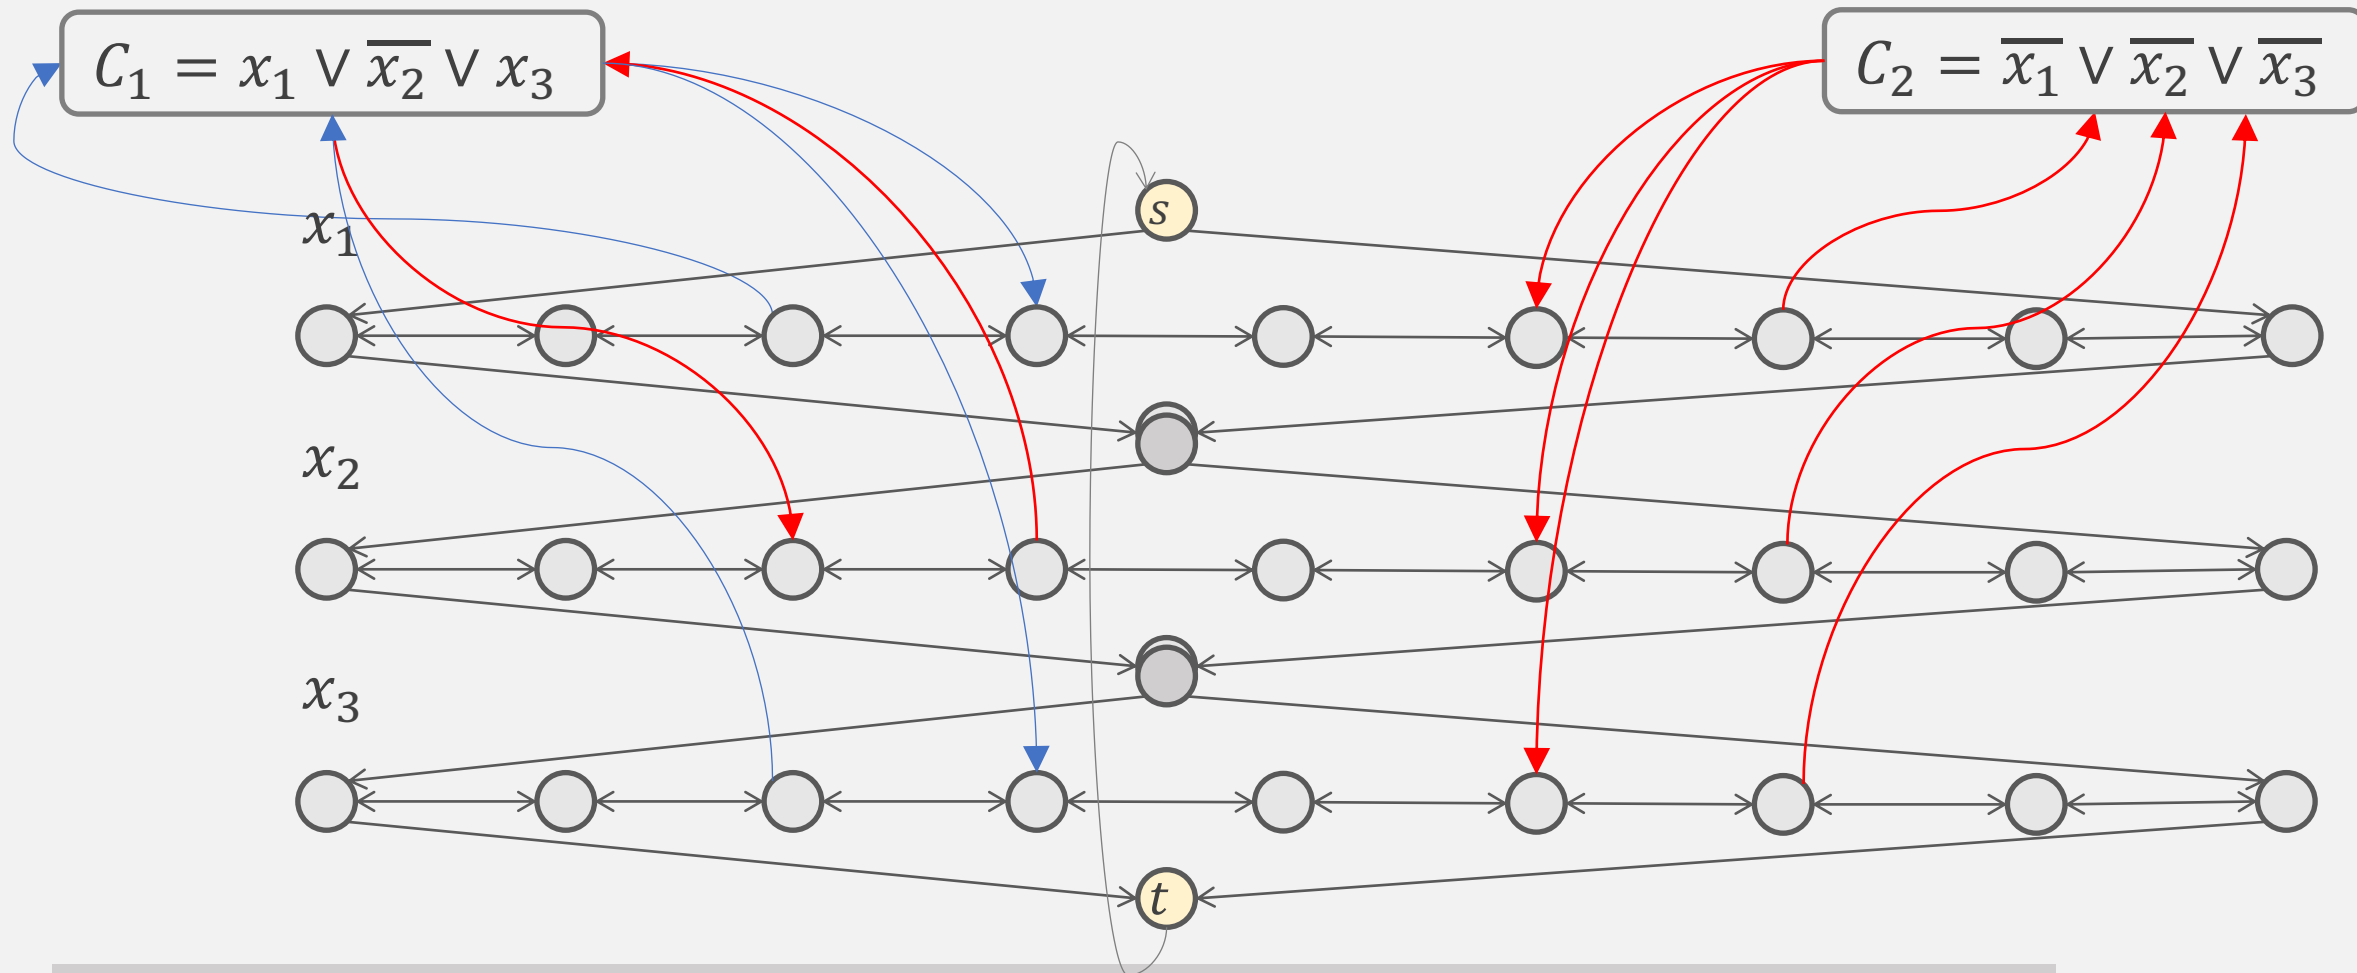

Theorem. $3\text{-SAT} \leq_P (\text{DIR-})\text{HAM-CYCLE}$

Pf. Given 3-SAT instance Φ in CNF: n variables x_i and k clauses C_j

Intuition: traverse row i from left to right \Leftrightarrow set variable $x_i = \text{true}$

3-SAT \leq_P (DIR-)HAM-CYCLE

Claim. Φ is satisfiable iff. G has a Hamiltonian cycle

3-SAT \leq_P (DIR-)HAM-CYCLE

Claim. Φ is satisfiable iff. G has a Hamiltonian cycle

(\Rightarrow) Suppose Φ has a satisfying assign. x^* . Define an H-Cycle in G :

- if $x_i^* = \text{true}$, traverse row x_i from left to right
- if $x_i^* = \text{false}$, traverse row x_i from right to left
- For each clause C_j pick (only) one row i and take a **detour**

(\Leftarrow) Suppose G has a H-Cycle Γ . Define a satisfying assign. in Φ :

- In Γ , replace edges going/leaving C_j with the edge of the corresponding two nodes in some row. This gives a new cycle Γ' in $G - \{C_1, C_2, \dots, C_k\}$
- In Γ' , set $x_i = \text{true}$ if Γ' traverses row i left-to-right; set $x_i = \text{false}$ otherwise
